TITLE: In the Forging Shop (V kuznechnom tsekhe)

PERIODICAL: Metallurg, 1957, No.10, pp. 20 - 21 (USSR)

ABSTRACT: Developments in the forging shop at the "Dneprospetsstal'" Works since the completion of its reconstruction in 1950 are briefly described. Main advances have been the extension of forging to include hard steels (many trials having been carried out jointly by the operating and central laboratory staffs, the forging of 160 - 200 mm diameter rounds direct from ingots, the minimisation of decarburisation, the mechanisation of handling operations (Figs. 1 and 2) and improvement of facilities. There are two figures.

AUTHOR: Blagoveshchenskiy, M.V.

TITLE: On Calculating the Initiation of Oscillations in Self-Oscillators

PERIODICAL: Tr. Mosk. energ. in-ta, 1958, Nr 31, pp 5 - 13

ABSTRACT: The author investigates theoretically the process of the initiation of oscillations in a thermionic oscillator.²⁶ This process arises when a square modulating pulse is supplied to the oscillator. Disregarding grid currents and electron inertia and considering the self-oscillator as a non-autonomous system subject to the influence of an external potential, the author obtains a symbolic equation describing the transient behavior of the oscillator. He assumes that the duration of the modulating-pulse front is infinitely small. Using the approximation method, he examines transient behavior for the harmonic component of the driving voltage of the oscillator. The theory is adequate in the absence of plate-current cutoff and in case the mean transconductance is constant. By way of illustrating the proposed method of calculation, the author carries out an approximate solution of the problem of the

TITLE: Frequency measurement in a pulse

PERIODICAL: Referativnyy zhurnal. Avtomatika i radioelektronika,
no. 9, 1961, 19, abstract 9 II13 (Tr. Mosk. energ.
in-ta, 1961, no. 34, 399-410)

TEXT: A method is presented for measuring the instantaneous frequency of a repetitive oscillation, with a repetition rate Ω_n , of variable frequency $u(t) = U(t) \sin [\omega_0 t + \Phi(t)]$, where

ω_0 is the initial frequency. In essence, the correction of frequency $\Delta\omega(t) = \frac{d\Phi(t)}{dt}$ is determined. For this purpose the oscillations

$u(t)$ are brought to the vertical deflection plates of an oscilloscope with a delayed time base of repetition frequency Ω_n ; the beam is intensity modulated by short pulses with ω_k repetition

Card 1/3

Frequency measurement in a pulse

frequency. When Ω_n and ω_k are multiples, the brightened points on the screen are immobile. When the oscillation frequency $u(t)$ is constant and equal to ω_k , it can be obtained by an appropriate choice of the phase of brightening pulses, that the brightest points lie on the line coincident with the axis of oscillations on the screen. When the oscillation frequency $u(t)$ varies with time, this "equiphaseline" is curved. When $\omega_k = n\omega_0$ where $n = 2, 3, 4..$, n equiphaseline are obtained on the screen. It can be proved that with an even $n \varphi(t) = \arcsin \frac{z(t)}{A(t)}$ where $z(t)$ is the spacing

between equiphaseline the points of which are displaced by half-period of ω_0 , and $A(t)$ is the spacing between envelopes of $u(t)$. $\Delta\omega(t)$, which is to be found, is by graphical differentiation determined from $\varphi(t)$. The resolving power of the method, i.e.

$\frac{\Delta\omega_{\min}}{\omega_0} \approx (4 \div 0.4) \cdot 10^{-4}$, where $\Delta\omega_{\min}$ is the minimum detectable value of $\Delta\omega$. The accuracy of the method is determined, first of

Frequency measurement in a pulse

all, by the duration of the brightening pulses which must not exceed $1/20 - 1/50$ of the period of ω_0 , if the equiphaseline is not to become blurred. This condition limits the application of the method to $0.5 - 1$ mc/s, for an accuracy of 10^{-4} , when the brightening pulse duration is $0.1 - 0.05 \mu\text{sec}$. The range of investigated frequencies can be extended to $25 - 50$ mc/s by substituting sine-wave oscillations of $100 - 150$ mc/s for the brightening pulses, and to dm waves, $30 - 50$ cm, by heterodyning the spectrum of the investigated pulse down to the IF of $20 - 50$ mc/s. Circuits of the apparatus are shown with a fixed ω_k - for the study of systems working at frequencies which are multiples of ω_k , and of a more flexible, but less accurate equipment with adjustable ω_k . Results are given of an investigation of oscillation build-up in an oscillator.

ACC NR: AP6019012

difference from its nominal value. To reduce this error signal to zero, a phase shifter is connected to one of the PhD inputs; this makes a phase-difference reference unit. The error signal between PhD and PhM can be amplified by a d-c amplifier with a 1-f filter LFF, which should take into account the inertia of the d-c amplifier and PhD. The error signal is applied to PhM corrects the phase deviation. Stabilizing characteristics of the automatic phase control are studied by setting up and examining its differential equations. The operation of the automatic phase control is illustrated by an example of a simple single-circuit resonant rf amplifier, with a reactance tube playing the role of PhM. The small-disturbance stability of the automatic-phase-control system is investigated for the cases of single-section and two-section RC filters. Orig. art. has: 7 figures and 29 formulas.

TITLE: Automatic phase control in reflex-type amplifiers

SOURCE: Elektrosvyaz', no. 2, 1966, 23-30

TOPIC TAGS: SHF amplifier, reflex klystron, electronic amplifier

ABSTRACT: An automatic phase control (APC) is suggested for widening the band and stabilizing the operation of reflex-type SHF amplifiers¹⁵. A phase detector compares the input- and output-signal phases, and the error signal is used to control the phase shift; this can be done, for example, by controlling the repeller voltage. The article theoretically investigates the effect of signal-frequency

deviation and APC-circuit parameters on the amplitude and phase in the reflex amplifier; also, the filtering characteristics of such an amplifier are explored. Equations describing the resonance curve and phase characteristic of an APC amplifier are set up; the introduction of APC considerably widens the amplification area. Curves are given for selecting the APC parameter to ensure specified noise filtration. An experimental verification with a reflex klystron permitted widening a 3-Mc amplifier band to 32 Mc (at 3000 Mc; gain, 25 db). Orig. art. has: 7 figures and 15 formulas.

BLAGOVESHCHENSKIY, N. A. and NATAPOV, B. S.

TERMICHESKAYA OBRABOTKA METALLOV (Heat treatment of metals).

Metallurgizdat, 1955. 392 p., diagrs., tables, 16,000 copies printed.

ANALYSIS AND EVALUATION

This book deals with the theoretical principles and practical applications of the processes, techniques and operations of the heat and chemical-thermal treatment of ferrous metals, especially steel. The structure, properties and special features of different types of heat-treated steel are presented. The test is well supplied with diagrams, charts and tables giving chemical composition, properties, applications and data on heat treatment of a number of steels manufactured in the USSR. This reference material is the most valuable in the book and therefore it has been specifically indicated in this review.

The book is intended as a textbook for metallurgical colleges and can also be useful for students of metallurgical institutes.

ABSTRACT	:	Trials were conducted from 1946 to 1953 in Tatariya on thin-layered flood-lands and loamy soils. Studied were varieties with different degrees of fast ripening, influence of vernalization on tuber formation and tuber yields in summer plantings, mulching with humus, application of different amounts of manure and dressings of mineral fertilizers. Interrelation between fast maturing, character of tuber formation and the degree of branching in different varieties was studied. It is pointed out that in some varieties the yielding ability of potato is 2-3 times higher

Abstract : The experiments of 1946-1953 at the "Memory of Lenin" Kolkhoz in the Stolbishchenskiy Rayon of the Tatar SSR are expounded which were on raising potatoes in the diverse soils characteristic of the small river bottom land of the Tatar ASSR. The yielding capacity of potatoes of individual varieties on bottom land soil is 2-3 times higher than in the waterless valleys. The largest yield on these soils is given by medium early varieties (the Sovetskiy, Oktyabrnok, Polesskiy). The improvement of potato seed quality is principally explainable by the

PERIODICAL: Tr. Tsentr. n.-i. in-ta mor. flota, 1955, Vol 1, Nr 1, pp 36-56

ABSTRACT: The functional principle of a device based on the properties of G. Ye. Pavlenko's loading and balance diagrams is described. The device affords a means for determining the dead weight, water displacement, bow draft, stern draft, and metacentric height during the entire course and at the completion of the loading procedure prescribed by the loading schedule. Different versions of the device include frictional, link-type, and conical gear multiplying mechanisms. The basic design principles of the device are adduced, together with a method for the solution of various problems. Bibliography: 4 references. Yu. M. Guliyev

The effect of snake venom on the catalase of the blood of man. V. A. Blagoveshchenskiy and F. F. Telyzin. Doklady Akad. Nauk. S. S. S. R. 80, 133-5(1951). - The method of Eiler and Josephson was used in the analysis of blood for catalase. The effect upon catalase of the venom of the following was studied: Ccbra (*Naja naja*) as representative of Colubridae, *Vipera raddei* and *V. lebentina* as representative of Viperidae, and *Ancistrodon blomhoffi* as representative of the Crotalidae. Desiccated venom was used and was added to the blood catalase prepus, in concns. of 0.1-0.0016 mg./ml. Cobra venom activated blood catalase in a broad range of concns. and increased in effectiveness with rise in temp. The venom of the Viperidae and Crotalidae strongly depressed blood-catalase activity in a dissimilar manner. Unlike the venom of Viperidae, that of Crotalidae enhanced the activity of human-blood catalase in concns. of 0.013-0.0033 mg./ml. Higher temps. reduced this catalase-activity enhancement. The addn. of snake venom affected the temp. coeff. of the H₂O₂-decompn. reaction by human-blood catalase.

Title : Questions on the Course of Carbohydrate Exchange
in Clostridium Oedemations.

Orig Pub : Biokhimiya, 1957, 22, No 3, 523-526

Abstract : Aldolase fructosodiphosphate was uncovered in
cells of Cl. oedemations. Optimum pH for the
aldolase in phosphate and veronal buffers is
shifted beyond the zone of detection of pH, to
the alkaline side; in borate, to the acid. The
aldolase is depressed by the ions of Ca^{2+} , Mg^{2+} ,
 Mn^{2+} , and particularly strongly by Zn^{2+} . Op-
timun temperature of the ferment -- 50-60°. By
fermenting glucose with Colstridium, such inter-

TITLE: Dynamics of phosphorous compounds in the process of C_t. perfringens
development

SOURCE: Biokhimiya, v. 30, no. 4, 1965, 675-680

TOPIC TAGS: fungus, toxicology, phosphorous compound/BP6K toxigen, 2836
toxigen

ABSTRACT: The object of the article was to study the special characteristics of the metabolism of phosphorous compounds in C_t. perfringens in connection with the formation of toxins. Test materials were strain BP6K toxigen and the weak toxin No. 2836. A partially synchronized culture of C_t. perfringens was obtained as follows. A fresh culture, containing $2 \cdot 10^9$ living microbic cells per ml, was planted in 500 ml of a medium with the following composition (heated to 37C): casein hydrolyzate obtained from the fungus Aspergillus terricola; NaHPO₄ 2.3 gram/liter; MgSO₄ 0.02 gram/liter; KH₂PO₄ 0.25 gram/liter; lumps of muscle 33 grams/liter; and, glucose 0.5%. A culture with $5 \cdot 10^9$ cells per 500 ml was introduced into the medium and placed in a thermostat at 37C. After 15 min of Card 1/3

L 20997-66

ACCESSION NR: AP5021649

development, an equal volume of fresh medium cooled to 0-2C, was rapidly added to the culture and the temperature dropped to 20-22C, after which it was again placed in a thermostat at 37C. Microscopic analysis showed that, after cooling, the cells ceased to divide but continued to grow, increasing in size by 2-3 times. A study was made of the behavior of phosphorous compounds during these operations. It was shown that the separating out of toxins in cultures of strain Cl: ~~C. perfringens~~ toxigen is connected with a change in the phosphorous containing compounds and that it is accompanied by an expenditure of energy. During the process of cell division and of the separating out of toxin in the bacteria of the toxigen, the content of phosphorous compounds decreases sharply. Microbes of a toxigen before the start of separation have the capacity to accumulate a greater amount of phosphorous compounds than microbes of a nontoxigen. "The authors wish to thank I. S. Kulayev and M. S. Kritskom for consultation on the work."

TITLE: Study on the formation and interaction of enzymes in the toxic Clostridium perfringens complex

SOURCE: Zhurnal mikrobiologii, epidemiologii i immunobiologii, no. 11, 1965, 61-65

TOPIC TAGS: enzyme, bacteria, bacteriology, biochemistry

ABSTRACT: Lecithinase, collagenase, hyaluronidase, and proteinase were present in Cl. perfringens cells grown from 1½ to 4 hours. Considerable amounts of lecithinase were found in the culture fluid in the course of the experiment. In some experiments collagenase and hyaluronidase were present in the microbial cells but absent in the culture fluid.

Crude exo- and endoproteinases of the pathogen of gas gangrene possessed very low proteolytic activity, while concentrated, highly active proteinases in vitro experiments did not inactivate Cl. perfringens toxin or lecithinase. Trypsin, however, sharply inactivated both the toxin and purified lecithinase.

TITLE: Changes in the composition of the bacterial mass of Clostridium perfringens, type A,
during cultivation

SOURCE: Byulleten' eksperimental'noy biologii i meditsiny, v. 61, no. 4, 1966, 74-77

TOPIC TAGS: RNA, DNA, bacteriology, bacteria, plant metabolism, biosynthesis,
protein, toxin

ABSTRACT: Changes in the bacterial mass with respect to the content of high-molecular
N-containing substances, RNA, DNA, and the total content of P during the developments
of cultures of Clostridium perfringens strains with varying toxigenicity were studied. The
data in question are of importance in connection with the investigation of characteris-
tics of metabolism of the microorganisms that are related to the formation of toxin.
For highly toxigenic strains a predominance of decomposition of RNA and of proteins to
low-molecular compounds over their synthesis was found during the process of develop-
ment, while cultures of weakly toxigenic strains retained a capacity for intensive
synthesis of RNA and proteins. Cultures with moderate toxigenicity occupied an
intermediate position. Orig. art. has: 3 figures and 1 tabla. [JPRS: 36,932]

TITLE: Source of high-intensity protons

SOURCE: Pribory i tekhnika eksperimenta, no. 1, 1964, 30-33

TOPIC TAGS: ion source, high intensity proton, high intensity proton source, electron fore injector, 10 Gev proton synchrotron, duoplasmatron

ABSTRACT: An ion source is described which is capable of developing a proton emission of 1.5 amp and was used in 1956 as a fore-injector in the 10-Gev proton-synchrotron at the Joint Nuclear Research Institute. The design of the source with magnetically contracted discharge is shown in Fig 1, its electric-supply scheme in Fig 2, Enclosure 1. Emission characteristics of the source were investigated under rather long (100 microsec) pulse conditions; the effect of the arc current, magnetic field, and gas pressure upon the ion current are reported. The basic parameters of the ion source are:

Card 1/2

ACCESSION NR: AP4018358

Accelerating voltage	30 kv
Ion emission current	1.5 amp
Arc current	20 amp
Arc voltage	110-120 v
Gas pressure	(5-7) x 10 ⁻³ torr
Magnetic field	1,000 gauss
Emission port diameter	6 mm
Proton component	85%

"Errors in Piloting Techniques and Methods of Prevention," V. Blagoveshchenskiy, 4 pp

"Vestnik Bozduzhnogo Flota" No 7 (341)

It is necessary to correct piloting techniques as the errors become greatly magnified in carrying out figures of complicated maneuvers. The article does not give any detailed methods for correcting errors in fighter or bomber tactics, but does deal briefly with errors in the training of new pilots. The statement is made that one only efficient method of discovering why a

pilot makes certain mistakes is to have him under observation at all times, whether in the air or on the ground.

TITLE: Fluorine derivatives of acetylene hydrocarbons. α -fluorinated perhalogenpropines

PERIODICAL: Zhurnal vsesoyuznogo khimicheskogo obshchestva imeni D.I. Mendeleyeva,
v. 7, no. 5, 1962, 580 - 582

TEXT: The preparation of α -fluorinated perhalogenpropines of the type $CF_nHal_{3-n}C \equiv C-Hal$ was investigated ($n = 1, 2, 3$; Hal = Cl, Br). By means of dehydrohalogenation of monohydrohalogenpropylenes over calcinated sodium hydroxide at 210 - 290°C in a nitrogen stream was synthesized: 3,3,3-trifluoro-1-bromopropine-1; 3,3,3-trifluoro-1-chloropropine-1; 3,3-difluoro-1,3-dichloropropine-1; and 1-fluoro-1,3,3-trichloropropine-1. It is demonstrated that α -fluorinated perhalogenpropines give only dihalogen derivatives in a reaction with halogenes in chlorinated solvents without heating. Infrared spectra of the obtained perhalogenpropines showed for these compounds the characteristic absorption band at $2,200 \text{ cm}^{-1}$, being thus somewhat different from corresponding literature data. The band shift is ex-

plained by the effect of the halogen near to the carbon atom with the triple bond. This observation will be discussed in further papers. The presence of the triple bond was proved also by a successive addition of two and four halogen atoms. The fact that α -fluorinated perhalogenpropines react with chlorine, or bromine in the absence of a solvent, in light and at room temperature by explosion, while in the presence of chloroform, or methylene chloride only to dihalogen derivatives is explained by the assumption that the deactivating effect of the trimethylene group (in relation to an electrophilic attack) is spread only on one π -bond and has just a weak effect upon the other. The tetrachlor derivatives were prepared in sealed ampullas at elevated temperature, the tetrabromine derivatives only by irradiation with ultraviolet light in a quartz vessel. Basic experimental data are presented in a table.
